Abstract of **AT393444B**

An item of furniture has at least one drawer 2, which is held between two carcass side walls 1 by means of a runner fitting. The runner fitting comprises, on each side of the drawer 2, a loadbearing rail 3 on the carcass side and a runner rail 4 on the drawer side. The runner rails 4 are mounted obliquely in relation to the bottom of the drawer, the distance from the bottom of the drawer at the front being greater than at the back. The loadbearing rails 3 are mounted at their front ends so that they can rotate on the carcass side walls 1. The horizontal pivot axes are formed by screws 8. At their rear ends, the loadbearing rails 3 have vertical slots 9, through which the screws project as stop bolts 10, which limit the rotational angle of the loadbearing rails 3.
